# Reading your result

Everything on the previous page is measured live from public play counts — the same figures you saw when you ran Neon Tide. A few honest reads from that data:

**The dominant release is a collaboration.** Most of the value sits in a co-credited track, so the owner's realizable share depends on master/publishing splits a statement would confirm.

**Big streams, smaller owned audience.** The catalog leans on a breakout moment more than a dedicated fanbase — the clearest place to build durable value is converting listeners into followers.

**The band is wide (\$213,000–\$421,000) on purpose.** It's modeled from public streaming alone and is master-side only — publishing isn't included. A real royalty statement would narrow it considerably.

We built this to be accurate to what's public, not to flatter — which is why we'd rather show you the concentration and the gaps than hide them. If it matches what you already know about Neon Tide, the honest next step is to read it against your actual statements; that's where the range tightens and where anything uncollected would show up. Happy to do that read with you whenever it's useful.

## Extend the analysis — the Example Label roster

Neon Tide is one of several artists on the roster. The same baseline runs on any of them — a sample by Spotify following:

| Artist                 | Spotify followers |
|------------------------|-------------------|
| Artist Two             | 14,200            |
| Artist Three           | 6,100             |
| Artist Four            | 2,300             |
| + 5 more on the roster |                   |

**Want the same valuation + socials baseline for the rest of the roster? Reply and we'll run it.**

How this is calculated

Value is modeled as **sustainable annual Net Label Share (NLS) × a 10–16× market multiple**. NLS is what the owner keeps after artist royalties, distribution fees, and reserves — not headline streaming revenue. Annual run-rate is taken from the catalog's lifetime average; other platforms are approximated as a labeled share of Spotify. Directional estimate from public data, not an appraisal.
